

Deploying a static page to github pages.

Github pages lets you freely host your static ^{websites}.

You cant host a PHP server / a MySQL database, but you can do anything if its just HTML/CSS/JS.

1. Open your github repo and go to settings. Then click on pages in the left sidebar.

2. Then inside the Build and Deployment section, select source: Deploy from a branch, and select the branch to be main, and the folder to be / (root), then click save. Then you should see a progress notification showing your page and eventually it will be hosted.

☒ Enforce HTTPS

— Required for your site because you are using the default domain (`username-free.github.io`)

HTTPS provides a layer of encryption that prevents others from snooping on or tampering with traffic to your site.

3. Your done. Visit your website at `https://{username}.github.io/{repo}`
